Assignment 1 - Git & GitHub Fundamentals
Report Template

- ***Full Name:*** Kamelia Magdoline Milha
- ***Student ID:*** 164183
- ***Course Code & Section:*** CSC 3324 01
- ***GitHub Username:*** Kamelia-Magdoline

1. Repository Setup

Briefly explain how you initialized the repository and what you ignored in .gitignore.

I initialized the lab session folder as a local Git repository by running the command git init. As for the .gitignore file,I configured Git to ignore local environment files(*.env) and general log file(*.log).

2. README & Commit History

Briefly describe your README and how you organized your commits.

My README.md file include my name and GitHub username, a description of the project and a list of technologies used along with a block of code, a link to GitHub documentation and a banner to represent session 1's lab session. For my commits, I initialized .gitignore and updated the README.md, added project starter files, updated the HTML structure and main stylesheet, refactored application logic, created the feature/about branch and committed the about.txt file.

3. Selective Staging *Explain how you changed two files but*

committed only one of them first.

I modified two files in my working directory (index.html and about.txt). I used git add index.html to stage only index.html, leaving about.txt unstaged in the working tree. I then committed index.html on its own to demonstrate how to selectively stage and commit individual changes rather than staging everything at once.

4. Branch & Merge

Briefly explain the feature branch you created and how you merged it into main.

I created an isolated feature branch named feature/about using git checkout -b feature/about to work on the About section. After committing my changes on that branch, I switched back to the main branch using git checkout main and merged the feature branch into main using git merge feature/about.

5-Remote Changes

Explain the difference between commit and push, then fetch and pull.

A commit records staged changes locally on your machine, while a push uploads those local commits to the remote repository on GitHub. A fetch downloads updates from the remote repository without changing your working files, whereas a pull fetches remote updates and immediately merges them into your active local branch.

6. Fair Use of AI

I used AI to help me when I got stuck on how to check my changes using git diff and git diff --staged. It also helped me understand how .gitignore works, fix a problem with text encoding, and solve merge conflicts when my GitHub code didn't match my computer. I tested every command in my terminal myself before using it.

7. Sources & Reflection

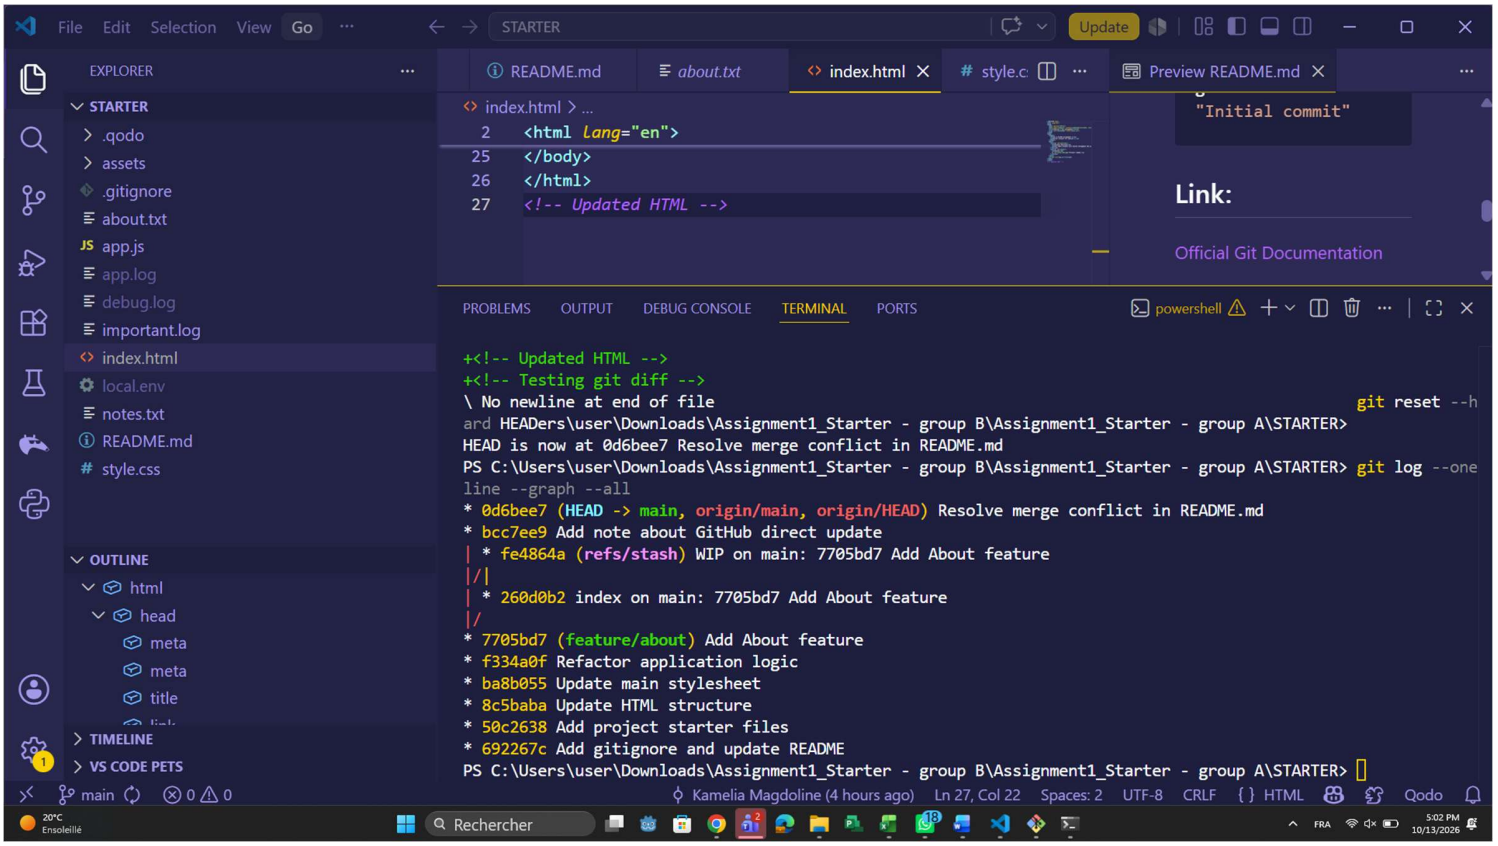

List any useful sources you used. Then write 2-3 sentences on the hardest concept and what you would check first if Git behaves unexpectedly.

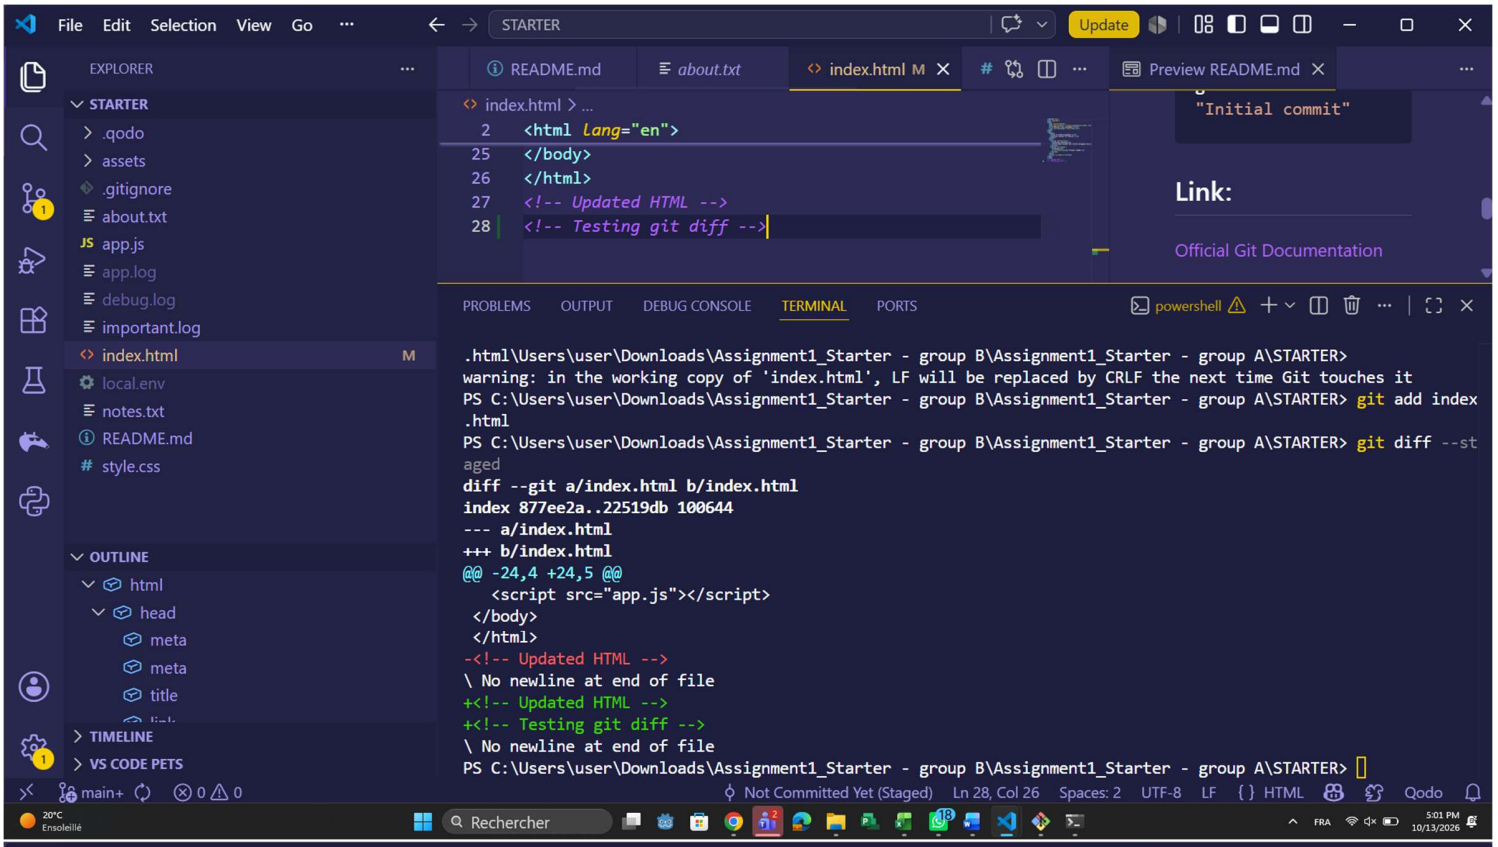

Sources: Official Git Documentation (git-scm.com).

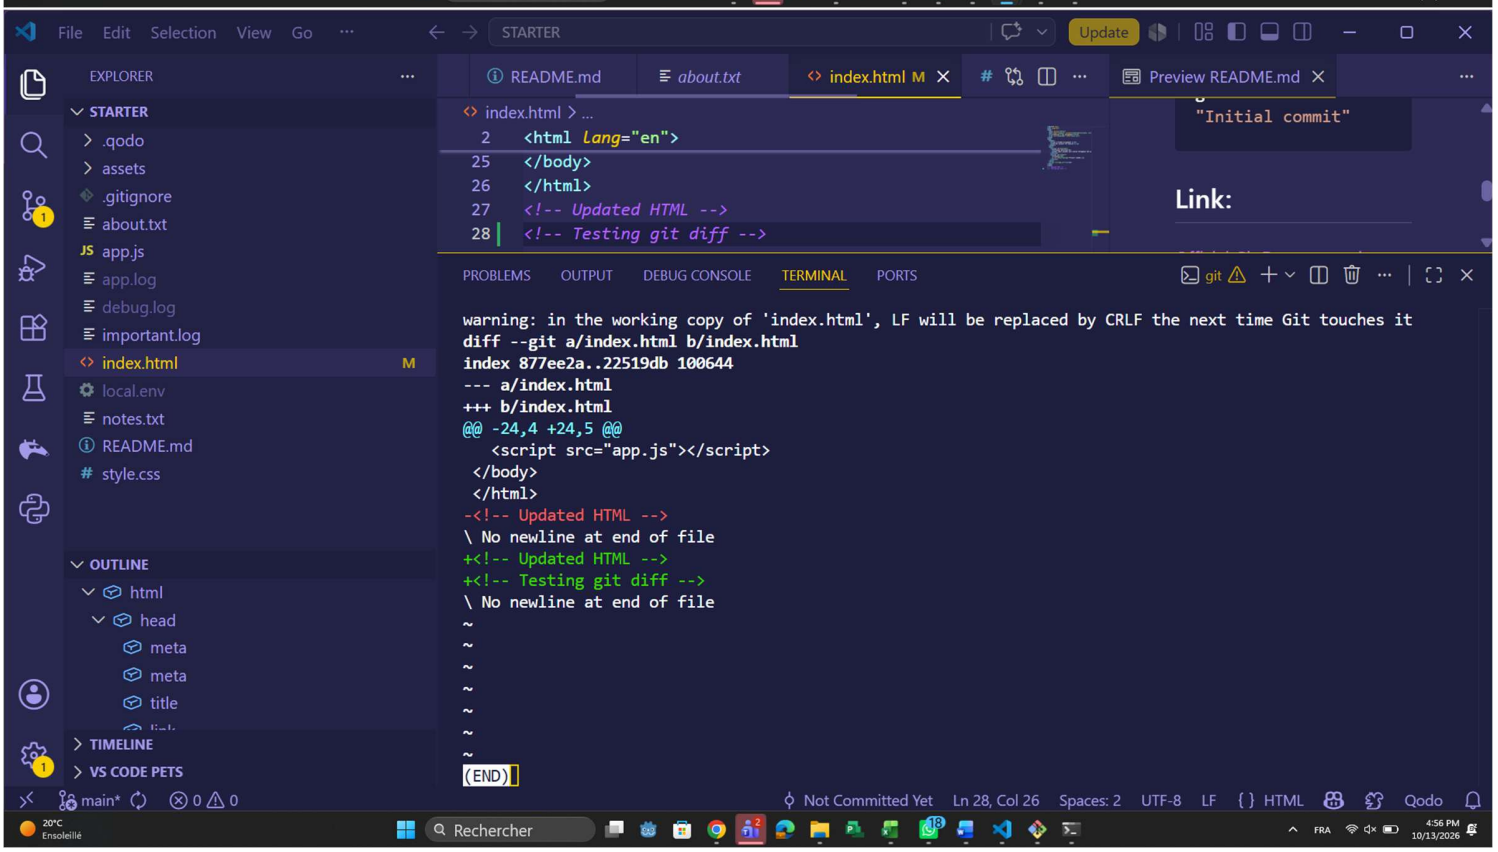

Reflection: The most challenging part was dealing with unexpected remote synchronization issues and merge conflicts. If Git behaves unexpectedly, the first thing I would check is git status to see the current state of the working directory and staging area.
